

HISTORIC BRICK COLLECTION

Introduction

Bricks are a near ubiquitous artefact on historic sites, however they have been rarely studies .A superficial examination of bricks indicates that numerous changes in dimensions,shape,colour,composition and decoration have occurred since 1826 (the date of the earliest brick manufacture in Victoria).It seems likely that if these changes could be documented then bricks could become a useful chronological marker for historic sites allowing the archaeologist,architect and historian to refine their dateing of various features on historic sites.

There is also the question of studying the economic history of the brick industry.Documentary evidence suggests that prior to the 1870's most country towns had local brickworks but that after this time the Melbourne based companies began the trade.The exact details of this have never been fully documented.The information collected to establish the dateing of bricks will also help to reveal the economic changes in the industry.

With this in mind the Historic Brick Collection has been established to provide archaeologists with a set of reference material and to collect information on bricks and the brick industry.

To do this it is intended to record data from bricks from dated or datable locations as the opportunity arises.Periodically it is intended to review the data to

establish whether any patterning is discernable. To support the catalogue it is intended to collect data on the history of the brick industry in Victoria.

Collecting Bricks

It is essential that bricks come from a known location and a dated or datable context. There is no point to collecting bricks without any information as defeats the whole point of this study. If we had wanted a dozen bricks we could have got them from the tip. Caution is to be exercise as the constant remodeling of buildings means that bricks may come onto the site at times different from the main building period.

The Catalogue

As bricks are recovered it is intended to record attributes that relate to their size, shape, decoration and colour.

Page 1 records details of the bricks location, its age and manufacturer (if known).

PAGE 2 records metrical and non metrical attributes

Dimensions are defined in Fig 1

Colouring is recorded by using a Munsell Soil Colour Chart or the Australian Standard Colour chart to standardise readings. Bricks should be washed prior to readings. The presence of mottling should be noted and the colour of the mottles should be recorded. (much in the way soil mottling is recorded)

Type this is a listing of type of brick and the

attributes used to identify the type of brick.(see the Labs brick file if unsure of attributes).

Frog a frog is an indentation made in one or two sides of a brick for the purpose of reducing the bricks weight and helping it "key" into the mortar.Fig 1 defines the dimensions of the frog.Lettering should be recorded as well as whether the letters are raised or not.

Perforations modern bricks seem to have a number of holes that serve the same purposes as the frog. These should be described as they occur.

Shape although bricks are essentially rectangular special shapes were manufactured.Fig 2 gives an example of such shapes for firebricks. At this stage a written description need only be given.

Page 3 illustrates the features of the brick. It must include records of all decorated faces of the brick,as well as a cross section to illustrate the shape

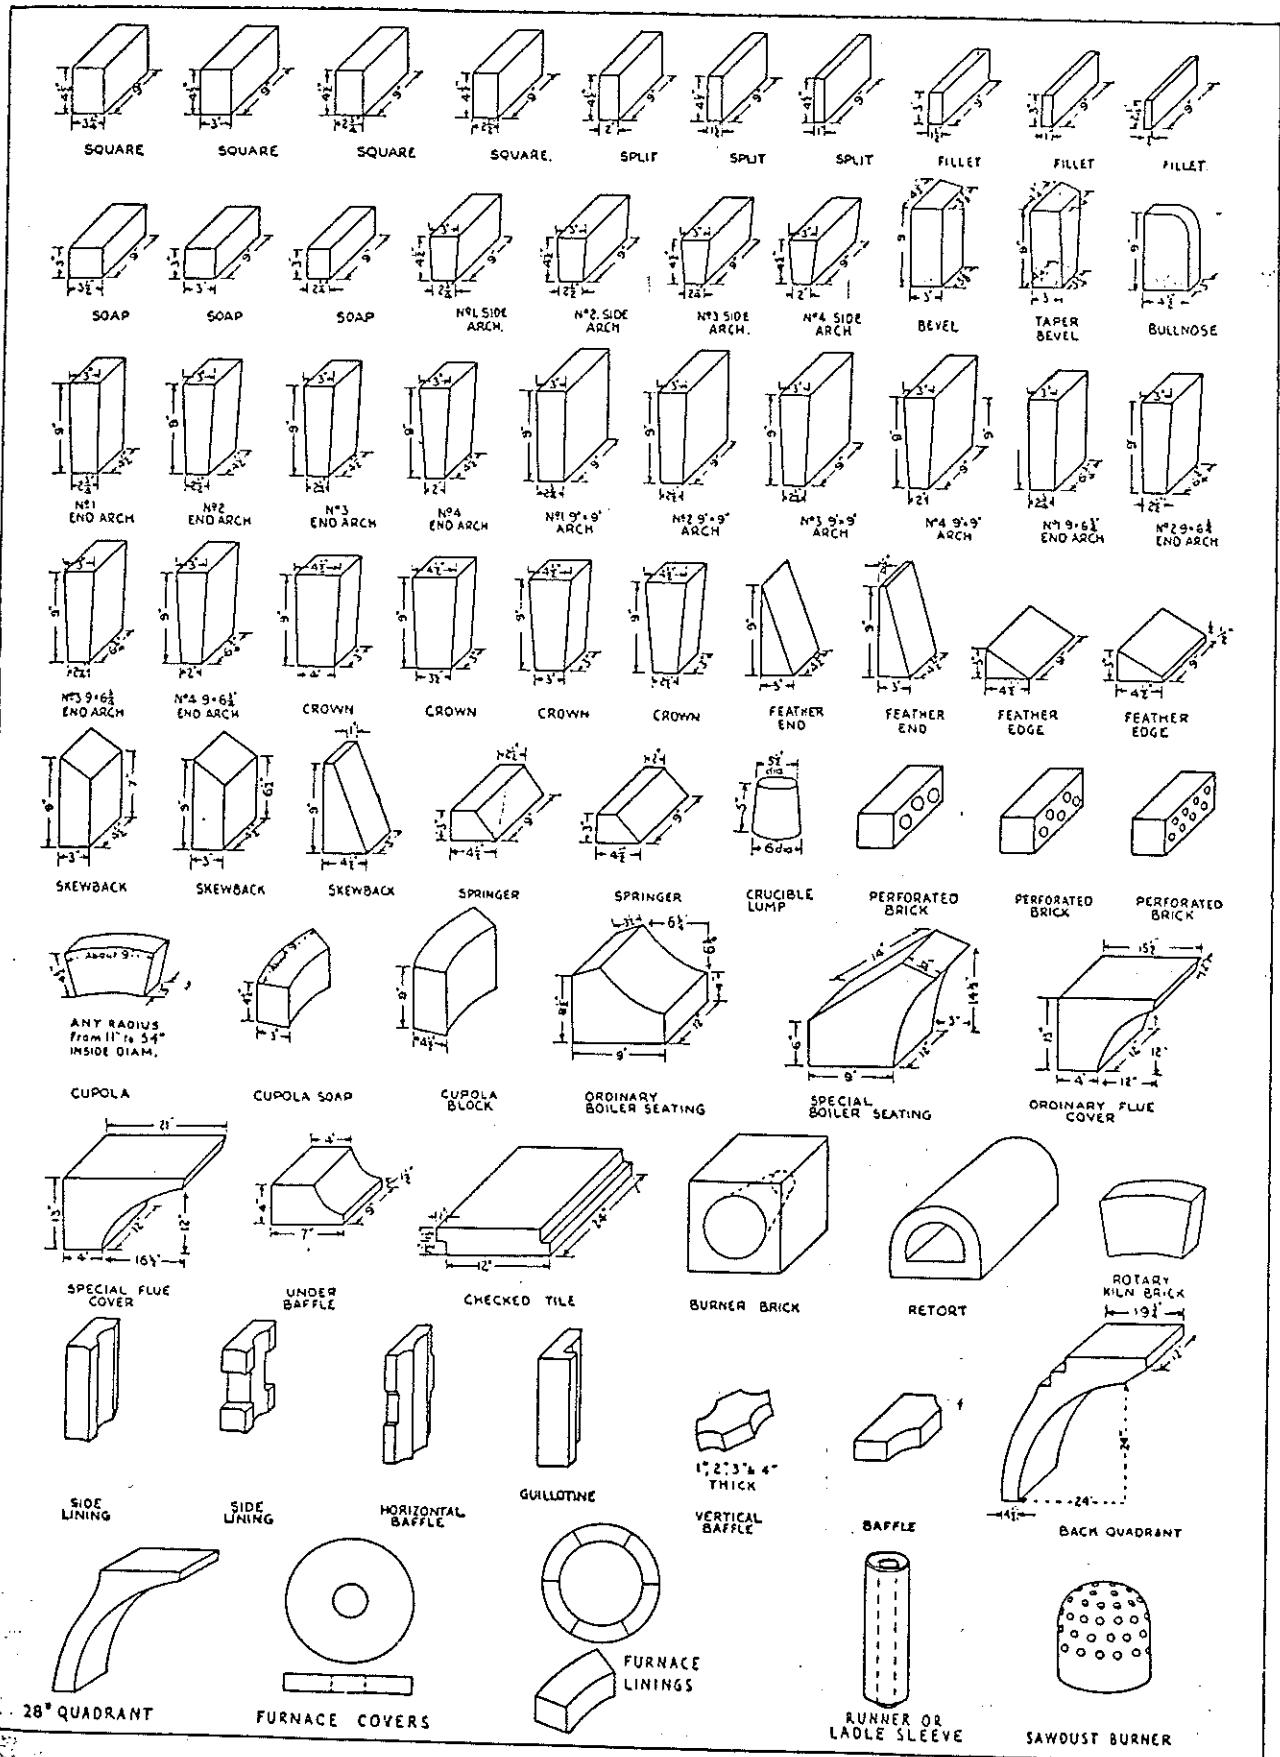

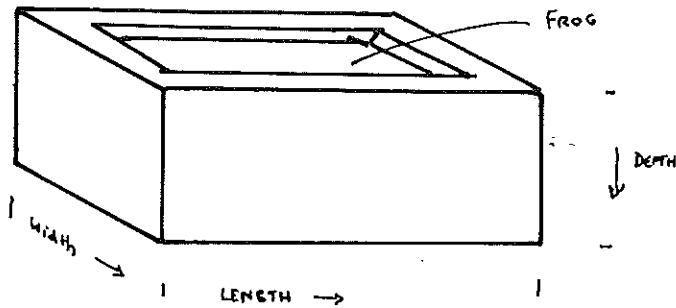

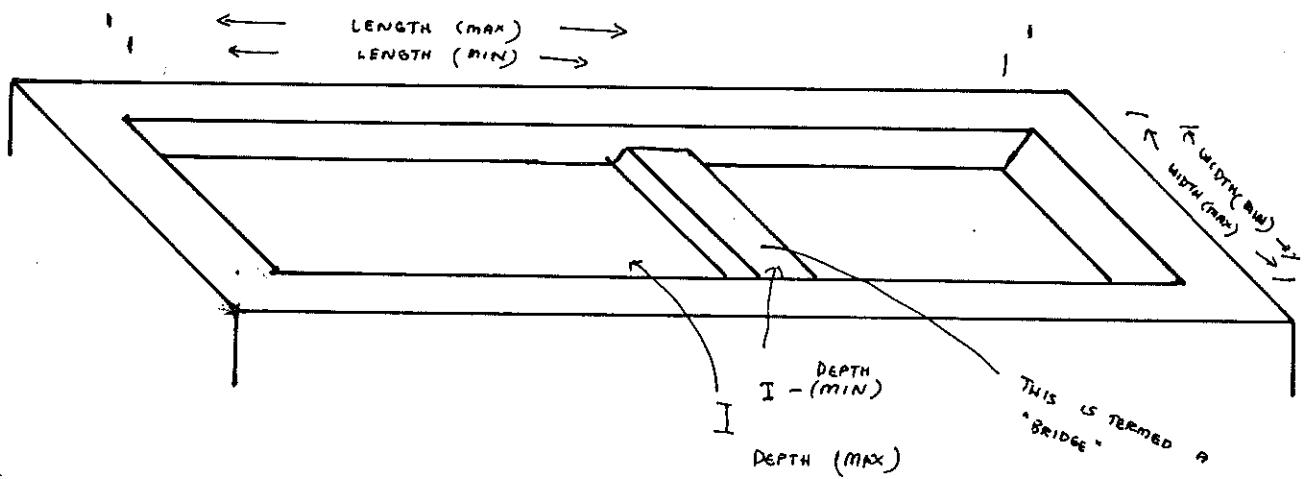

Fig. 8. Drawings showing different shapes produced by the Company.

HISTORIC BRICK COLLECTION - CATALOGUE

NO: 1

ENTERED (DATE): November 1982
(BY) : Anne McConnell

LOCATION FOUND: Wonthaggi

Collected by P. Coutts.

PLACE OF MANUFACTURE: State Coal Mine Brickworks, Wonthaggi

DATE/PERIOD OF MANUFACTURE: 1911 → (date uncertain but post 1910)

GENERAL INFORMATION:

NB S.C.M. brickworks opened in 1910. In this year a couple of trial runs of bricks were made - these do not have S.C.M. markings (A. Caulfield, pers.comm.)

DETAILS OF BRICK (based on hand specimen examination).

Length: 23.1 cm

Width: 11.0 cm

Thickness: 7.8 cm.

Colouring: Orange, with small red inclusions Rock slip 10 R 5/6-8
2.54R 6/6-8

General Description:

Even brick, hard, coherent, slightly darker orange slip on surface - v. fine
and shallow curved frog on one side with S.C.M. imprinted into
the frog. Contains 1/3 of small red clayey fragments; low porosity
